The municipality is very important in the development of communities. The development of a community can be understood from the municipality system. The municipality integrated with health is very significant for the development and progress of society. Thanks to the health integrated municipality, early diagnosis of diseases and access to patients can be facilitated, geriatric cares can be performed easily, health problems that are overlooked can be identified, infectious diseases can be prevented, statistical analysis of diseases can be performed, the density of hospitals can be decreased, physicians can devote more time to academic studies, unnecessary drug use can be reduced and countries can develop economically. Furthermore, education level can be increased, psychological support can be provided, unemployment and divorce rate and suicide risk can be decreased. Significant progress will be achieved in medical assistance with the cooperation of the municipality, non-governmental organizations and sensitive citizens. Regular and disciplined municipal work will provide significant progress and results in the field of medicine. This will significantly improve the fairness and accessibility of basic health services. Psychologists, sociologists, physicians and people from the public should work integrally for health care and ensure the development of social medical services. Diversified, differentiated and personalized health needs should be met. The content and model of social medical services should be expanded and improved. Defective support policies should be corrected through administrative audits.

General conditions

1. Focus on progress by building a healthy community,
2. Ensure that basic medical and health commitments are committed to public welfare,
3. Make everyone available to the basic medical and health system.

Health services, municipality and social services accurately handle the relationship between poor, rich, sick and elderly people. With the strengthening of standard management and service, supervision, preventive health services and economic growth will gain momentum.

Basic principles

People-oriented and coordinated progress should be made. Improving the health of all people should be considered as the main starting point. The main purpose is to use the resources of society to accelerate finding the cause of medical problems. Efforts are needed to ensure the integration of social and economic benefits and to effectively protect people's health rights. This will be ensured by disciplined and lawful municipality.

Tasks
Medical technology, service quality and brand reputation should be improved significantly. Health insurance and medical technology support should be further strengthened and industry development fully optimized. A number of socially operated medical institutions with strong service competitiveness should be created.

General medical services
High-level general clinics organized and operated by the municipality, social services and provincial health directorate should be developed. A professional, community-based team of general practitioners, nurses and other healthcare professionals should be built.

Special services
Special medical care teams should be established. These teams should be supervised by the officials appointed by the city administration. Voluntary teams related to all areas of medicine should be established and individuals should be reached by these teams. Seminars should be organized and the public should become a conscious society. Thus, unnecessary drug use can be reduced.

Traditional medicine
The importance of traditional medicine should be explained with the municipality teams, seminars should be given and public awareness should be provided. Scientific articles and books about traditional medicine and rehabilitation should be published.

Personalized medical services
Health services should establish appropriate and rapid medical treatment procedures. A comfortable and warm medical treatment environment should be created. A variety of personalized value-added and assistive services to patients, such as remote consultation, private guided medical attendants and family wards to comprehensively improve service quality can be provided.

Table 1. One-week sample program of municipality personnel

<table>
<thead>
<tr>
<th>Day</th>
<th>Activity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monday</td>
<td>Make home visits with the team, identify people living in the family, listen to their needs and worries, determine those with health problems</td>
</tr>
<tr>
<td>Tuesday</td>
<td>Evaluate home visits with the team, make a program</td>
</tr>
<tr>
<td>Wednesday</td>
<td>Discuss with the team about what can be done to eliminate the problems experienced by families, share tasks</td>
</tr>
<tr>
<td>Thursday</td>
<td>Meet families again and guide them for their needs, e.g. doctor’s appointment for those with health problems</td>
</tr>
<tr>
<td>Friday</td>
<td>Get information and feedback by visiting health centers</td>
</tr>
<tr>
<td>Saturday</td>
<td>Supervising families and determining whether they have implemented the recommendations</td>
</tr>
<tr>
<td>Sunday</td>
<td>Evaluation of the work done during the week</td>
